

Table B-tree (data in leaves) + index B-tree

Diagram illustrating a B-tree structure for a table with 1000 rows (leaves) and an index B-tree (root and internal nodes).

The root node contains keys: 400 | 800.

The root node points to three leaf nodes (rows):

- rows 1-399
- 400-799
- 800-...

The leaf nodes are labeled "leaves: full rows".

An index B-tree structure is shown below the leaf nodes, with a node labeled "idx (folderId, rowid)".

An arrow points from the "idx (folderId, rowid)" node to the "400-799" leaf node, labeled "rowid → 2nd lookup".

Text below the diagram: "one page read per level: ~3-4 reads for millions of rows; covering index = no 2nd lookup".
